

3.2.3.

3.2.3. Simplified submission workflows for single objects

While submission of simple, single objects is straightforward, deposit of more complex objects or batches of objects still raises unacceptably high barriers to widespread adoption. Merritt should support significantly simplified submission workflows, possibly facilitated by new easy-to-use client-side tools, such as a "drop box" type of functionality. This activity will result in phased incremental enhancements, possibly including an automated manifest builder, support for Sword/Atom submission protocols, reimplementaion of submission UI taking greater advantage of Dropbox-like Javascript/AJAX; ONEdrive-like desktop client supporting a file browser user experience. Merritt users will have simpler ways to submit their content
