3.1.1.

3.1.1. Visibility of key metadata elements, including author/creator affiliation, journal citation, and abstract

Currently, only supplied Dublin Kernel (DK) metadata fields are visible through the Merritt UI. (Arbitrary metadata may be supplied as a component of a submitted data set. It is stored and is retrievable, although not currently visible.) Merritt should deploy additional schema parsers to recognize and surface metadata elements found as components of a submitted content. Merritt users will be able to submit metadata in various formats, e.g. MODS. Merritt will be able to process these metadata and allow for search and display of metadata in their native formats.
